¹ Includes graduate scientists (level master) but not registered as doctoral students or undergraduate students participating in research projects.

² Including leaders of the individual projects and other organisational units of the NCCRs

³ Full-time equivalent, including NCCR-Director and persons in charge of knowledge and technology transfer, equal opportunities, communication, education and training

### Gender in the NCCRs

- **Research associates**: 58% female, 42% male
- **Doctoral students**: 38% female, 62% male
- **Postdoctoral students**: 32% female, 68% male
- **Senior researchers**: 29% female, 71% male
- **Management**: 53% female, 47% male
- **Other staff**: 62% female, 38% male
- **Review Panel members**: 24% female, 76% male
NCCR Chemical Biology
Visualisation and Control of Biological Processes Using Chemistry

NCCR Director: Prof. Howard Riezman, NCCR Co-Director: Prof. Christian Heinis
Home Institutions: University of Geneva, EPFL
Start date: 1st of December 2010 (3rd NCCR series)

Description
The National Centre of Competence in Research (NCCR) "Chemical Biology - Visualisation and Control of Biological Processes Using Chemistry" uses chemistry tools to obtain a better understanding of life at the molecular level. Until now, few technologies could characterise in detail the countless biochemical activities that constitute a living cell. In the NCCR Chemical Biology, chemists, biochemists, biophysicists and cell biologists develop innovative techniques based on small molecules and proteins to obtain new information about cellular processes and control them in situ. The new tools are applicable to various biological phenomena like visualising the activity of selected proteins during cell division and investigating how membranes control the activity of proteins in them. The NCCR is also engaged in establishing a platform for chemical screening aimed at developing a new generation of molecules with biological effects. NCCR Kidney.CH
Kidney Control of Homeostasis

NCCR Director: Prof. Johannes Loffing
Home Institutions: University of Zurich
Start date: 1st of August 2010 (3rd NCCR series)

Description
The National Centre of Competence in Research (NCCR) “Kidney.CH – Kidney Control of Homeostasis” is the world’s first research network to explore the physiological processes in healthy and diseased kidneys across a broad thematic spectrum.

The aim is to seek insights for new preventive, diagnostic and therapeutic approaches to treating kidney patients. The motivation being that kidney diseases have increased dramatically in recent years. Patients with chronic kidney diseases risk exposure to further secondary diseases such as high blood pressure or osteoporosis. Reduced kidney function has drastic consequences for the body as the kidneys are responsible for maintaining the balance between the most varied of substances in the body (homeostasis). Homeostasis is of central importance to body functions and thus a healthy life.

NCCR LIVES
Overcoming vulnerability: life course perspectives

NCCR Director: Prof. Dario Spini, NCCR Co-Director: Prof. Eric Widmer
Home Institutions: University of Lausanne, University of Geneva
Start date: 1st of January 2011 (3rd NCCR series)

Description
The National Centre of Competence in Research (NCCR) "LIVES – Overcoming Vulnerability: Life Course Perspectives" analyzes the burdensome effects of post-industrial economies and societies on the development of vulnerability in terms of social exclusion or precariousness. It conducts comparative, longitudinal analysis to examine the impact of socio-structural and personal resources on overcoming vulnerability. Hosted by the Universities of Lausanne and Geneva, the NCCR brings together national and international researchers to examine life courses as developmental processes, as outcomes of institutional regulation and policies, or as biographical meanings. Life trajectories of about 25,000 people will be studied across health, family, work, and institutional domains in order to develop innovative social policy measures. For further information visit: http://www.lives-nccr.ch/en/

NCCR MUST
Molecular Ultrafast Science and Technology

NCCR Director: Prof. Ursula Keller, NCCR Co-Director: Prof. Thomas Feurer
Home Institutions: ETH Zurich, University of Bern
Start date: 1st July 2010 (3rd NCCR series)

Description
The National Centre of Competence in Research (NCCR) "MUST - Molecular Ultrafast Science and Technology", opens up new perspectives for the study of molecular systems and time-resolved structural investigations in physics, chemistry and biology. The NCCR "MUST" focuses on the multidisciplinary development of experimental and theoretical tools. Therefore researchers will investigate chemical reactions and energy-transfer processes at the atomic and molecular level, as well as electron and proton transfer processes with ultra short temporal and spatial resolution. A deeper understanding of matter at microscopic level is crucial for dealing with important social challenges such as the quest for alternative energy sources, the synthesis of complex, functional medicines, or the development of new electronic devices. For further information visit: http://www.nccr-must.ch/home.html

**NCCR QSIT**

**Quantum Science and Technology**

NCCR Director: Prof. Klaus Ensslin, NCCR Co-Director: Prof. Martino Poggio  
Home Institutions: ETH Zurich, University of Basel  
Start date: 1st of January 2011 (3rd NCCR series)

**Description**

The National Centre of Competence in Research (NCCR) "QSIT – Quantum Science & Technology" is active in a field which unites the key discoveries of the 20th century: quantum physics and information theory. In future, research in this field will strongly influence science and technology. Potential applications are primarily focused in the area of computer science and sensors. The NCCR "QSIT" takes a multi-disciplinary approach, combining concepts from physics, chemistry, engineering and computer sciences. Researchers from many Swiss universities and basic researchers from industry work together in the NCCR network. Their two common goals are to develop applications in the area of quantum computer science and to investigate new paradigms in physical basic research such as the order and states of material.

- **1646 scientific publications**
  - 7 not peer-reviewed anthologies thereof 1 joint by more than one group
  - 36 peer-reviewed proceedings thereof 1 joint by more than one group
  - 17 peer-reviewed other literature thereof 15 joint by more than one group
  - 552 journal articles thereof 1471 peer-reviewed and 325 joint by more than one group
  - 14 books thereof 5 peer-reviewed and 6 joint by more than one group
  - 18 book chapters thereof 8 peer-reviewed and 1 joint by more than one group
  - 2 peer-reviewed articles

- **3811 academic events**
  - individual talks
  - conference talks
  - invited talks or keynote lectures

- **501 transfer activities**
  - 245 cooperations
    - 22 with economy / industry
    - 222 with research institutions
    - 1 other
  - 45 technology transfer activities
    - 8 IP-rights
    - 2 prototype / demonstration
    - 5 start-ups / spin-offs
    - 5 CTI projects, thereof 1 joint by more than one group
    - 25 other kinds of technology transfer
  - 16 scientific services and tools*
    - 8 services, thereof 4 joint by more than one group
    - 8 tools
  - 148 public communications*
    - thereof 12 joint by more than one group

- **113 stakeholder exchanges**
  - thereof 3 joint by more than one group

NCCR Robotics

Intelligent Robots for Improving the Quality of Life

NCCR Director: Prof. Dario Floreano, NCCR Co-Director: Prof. Robert Riener
Home Institutions: EPFL, ETH Zurich (since the 1st of December 2014)
Start date: 1st of December 2010 (3rd NCCR series)

Description
The National Centre of Competence in Research (NCCR) "Robotics – Intelligent Robots for Improving the Quality of Life" encompasses a promising field of engineering which aims at developing new, human-oriented robotic technology. In the near future, intelligent robots will play an important role in improving quality of life. For example, "care robots" will help elderly people to stay in their familiar surroundings longer; "neuroprosthetic" and "exoprosthetic" robots will increase the mobility and autonomy of disabled person; "educational robots" will support the training of a new generation of scientists and engineers; "environmental robots" will keep our world cleaner and safer. In order to progress towards this vision, the NCCR "Robotics" is working towards developing fundamental insights in terms of technology, materials, and control mechanisms. For further information visit: http://www.nccr-robotics.ch/

The National Centre of Competence in Research (NCCR) "SYNAPSY – Synaptic Bases of Mental Diseases" aims to discover the neurobiological mechanisms of mental and cognitive disorders, since one of the major challenges in psychiatry is to achieve a better understanding of how these illnesses originate. It is hoped that this research will lead to the development of improved diagnostic tools and therapeutic approaches. The NCCR "SYNAPSY" focuses on the interface between preclinical research and clinical development, combining neuroscience with psychiatry. This research focus will help train a new generation of psychiatrists with both high clinical expertise and a sound knowledge of the basic neurobiological aspects of mental functions and dysfunctions.

NCCR TransCure
From transport physiology to identification of therapeutic targets

NCCR Director: Prof. Hugues Abriel
Home Institution: University of Bern
Start date: 1st of November 2010 (3rd NCCR series)

Description
The National Centre of Competence in Research (NCCR) "TransCure – From Transport Physiology to Identification of Therapeutic Targets" seeks to integrate the disciplines of physiology, structural biology and chemistry and to develop new therapeutic strategies for treating the most important diseases.

Transport proteins and ion channels play a key role in all physiological processes in the human body. Malfunctions in these proteins may contribute to the occurrence of diseases like diabetes, high blood pressure, osteoporosis and neuro-degeneration, and play a role in heart disease and cancers. The NCCR "TransCure" researchers aim to achieve a more profound understanding of the structures and mechanisms of these proteins. By broadening their knowledge of how transport proteins and channels work, they hope to develop new medicines. For further information visit: https://www.nccr-transcure.ch/

2 Including leaders of the individual projects and other organisational units of the NCCRs.

3 Full-time equivalent, including NCCR-Director and persons in charge of knowledge and technology transfer, equal opportunities, communication, education and training.

Gender in the NCCRs
NCCR Bio-Inspired Materials
Using Concepts from Nature to Create "Smart" Materials

NCCR Director: Prof. Ullrich Steiner
Home Institution: University of Fribourg
Start date: 1st of June 2014 (4th NCCR series)

Description
The NCCR "Bio-Inspired Materials – Using Concepts from Nature to Create 'Smart' Materials" aims to pool the expertise of its members in the fields of chemistry, physics, materials science, biology and medicine in order to study and find applications for new smart materials inspired by living organisms. This involves devising new design strategies and rules to create and assemble macromolecules and nanoparticles into ordered structures to produce smart materials with the desired properties. The NCCR conducts the relevant research in four interdisciplinary modules that focus on mechanically responsive materials across different length scales, biologically inspired assembly of optical materials, responsive bio-interfaces and surfaces, and dynamics of interacting cell-material systems.

NCCR Digital Fabrication
Innovative Building Processes in Architecture

NCCR Director: Prof. Philippe Block
Home Institution: ETH Zurich
Start date: 1st of June 2014 (4th NCCR series)

Description
The NCCR "Digital Fabrication – Innovative Building Processes in Architecture" aims to secure a leading position for Switzerland in this new and highly interesting sector, which is fast becoming a core discipline of architecture. Through a multidisciplinary approach the disciplines of architecture, engineering, robotics, and material and computer sciences are brought together in an ambitious partnership to establish digital technology as an essential part of future building processes. This new approach combines digitally mediated architectural design with robotic construction technologies to augment contemporary construction processes. The benefits of digital construction are evident: efficient use of production resources, material-specific concepts and durability, thanks to the seamless integration of design and fabrication. **NCCR MARVEL**

**Materials’ Revolution: Computational Design and Discovery of Novel Materials**

NCCR Director: Prof. Nicola Marzari  
Home Institution: EPFL  
Start date: 1st May 2014 (4th NCCR series)

**Description**  
The MARVEL NCCR ("Materials’ Revolution: Computational Design and Discovery of Novel Materials") aims to greatly accelerate the design and discovery of novel materials, via a materials’ informatics platform of high-throughput quantum simulations. These are powered by advanced electronic-structure capabilities for predictive accuracy; innovative sampling methods to explore configuration/composition space; and the application of machine learning and big data to computational materials science. Searches are targeted to materials for energy harvesting, storage, and conversion; materials for ICT; high value/high tech industries; and organic crystals. - Public sector: 2
- Other: 2
- Not known: 2

78% of postdoctoral students are employed in the academic sector.
NCCR MSE
Molecular Systems Engineering

NCCR Director: Prof. Thomas R. Ward, NCCR Co-Director: Prof. Daniel Müller
Home Institutions: University of Basel, ETH Zurich
Start date: 1st of July 2014 (4th NCCR series)

Description
The NCCR "MSE – Molecular Systems Engineering" combines the life sciences, chemistry, physics and engineering sciences in order to transfer the synthesis processes of biological cells to synthetic systems. Such molecular systems are the equivalent of tiny factories in which new compounds and substances are made. These can be used in energy supply and the chemical industry as well as in medical diagnosis or treatment.

The NCCR intends to break through the barriers of the traditional focus on individual molecular modules and develop new engineering principles that reveal how individual molecular modules can be combined to form working molecular production lines. The research findings could be used to meet future economic and technical challenges.

**NCCR On the Move**

### The Migration-Mobility Nexus

**NCCR Director:** Prof. Gianni D’Amato  
**Home Institution:** University of Neuchatel  
**Start date:** 1st of June 2014 (4th NCCR series)

**Description**
Migration to Switzerland has undergone a fundamental change in the past decade. Earlier patterns consisted mostly of long-term migration. However, the situation has altered due to changing national and European legislation and economic agreements between countries. Closely interlinked national and global markets have been further increasing temporary forms of mobility. Migratory reality today is thus more complex than ever and, so far, barely any systematic research has been conducted. The NCCR "On the Move – The Migration-Mobility Nexus" aims to better understand the changed migration and mobility patterns of today and its consequences for the State, the economy and society at large. This will provide a basis for an informed, forward-looking and sustainable migration policy.

**NCCR PlanetS**

**Origin, Evolution and Characterisation of Planets**

NCCR Director: Prof. Willy Benz, NCCR Co-Director: Prof. Stéphane Udry
Home Institutions: University of Bern, University of Geneva
Start date: 1st of June 2014 (4th NCCR series)

**Description**

The discovery of the first planet outside our solar system by Swiss astronomers in 1995 sparked a revolution in the field of astronomy. Not only did it help us to understand how planets are formed and evolve, but it also contributed to the development of instruments dedicated to the discovery of further exoplanets. By combining astronomical observations, measurements of solar system bodies using spacecraft, laboratory work and theoretical modelling, the NCCR "PlanetS – Origin, Evolution and Characterisation of Planets" aims to contribute to a better understanding of planets. In addition, the NCCR has coordinated the use of the CHEOPS instrument (CHaracterising ExOPlanets Satellite). For further information visit: [http://nccr-planets.ch/](http://nccr-planets.ch/)

NCCR RNA & Disease
The Role of RNA in Disease Mechanisms

NCCR Director: Prof. Oliver Mühlemann, NCCR Co-Director: Prof. Frédéric Allain
Home Institutions: University of Bern, ETH Zurich
Start date: 1st of May 2014 (4th NCCR series)

Description
The NCCR “RNA & Disease – The Role of RNA Biology in Disease Mechanisms” studies a class of molecules that has long been neglected: RNA (ribonucleic acid) is pivotal for many vital processes and much more complex than initially assumed. For instance, RNA defines the conditions, in a given cell, under which a given gene is or is not activated. If any part of this process of genetic regulation breaks down or does not run smoothly, this can cause heart disease, cancer, brain disease and metabolic disorders.

The NCCR brings together Swiss research groups studying different aspects of RNA biology in various organisms such as yeast, plants, roundworms, mice and human cells. By identifying the regulatory mechanisms that go off course during an illness, the NCCR will also be able to point out new therapeutic targets and help counter the biggest causes of death. NCCR SwissMAP
The Mathematics of Physics

NCCR Director: Prof. Stanislav Smirnov, NCCR Co-Director: Prof. Giovanni Felder
Home Institutions: University of Geneva, ETH Zurich
Start date: 1st of July 2014 (4th NCCR series)

Description
Physicists use the language of mathematics to describe the processes that they observe. However, mathematics is more than a language. It is also a collection of complex, evolving ideas. At the threshold between theoretical physics and mathematics – where the mathematician’s stringency and the physicist’s intuition bear the greatest fruit – both sides benefit from closer cooperation. The NCCR “SwissMAP – The Mathematics of Physics” aims to take this melding of minds to the next level and establish an internationally renowned Swiss Institute for Advanced Research in Mathematics and Physics. The objective is to create a place where researchers can focus on fundamental questions, such as whether string theory really is suitable for describing all of the known force fields and interactions in a uniform Theory of Everything.

NCCR AntiResist
New approaches to combat antibiotic-resistant bacteria

NCCR Director: Prof. Christoph Dehio
Home Institution: University of Basel
Start date: 1st of August 2020 (5th NCCR series)

Description
The NCCR "AntiResist" aims at developing new approaches to better understand the biochemical and biophysical processes caused by bacterial pathogens in infected patients, and to simulate them in tissue modelling. The findings will help researchers to develop new antibiotics more rapidly, and to identify new and innovative antimicrobial effect mechanisms on the basis of which new medicines can be developed.

Antibiotics play a vital role in many areas of modern medicine, especially protecting patients whose immune system has been weakened. But these achievements of modern medicine are now under threat. More and more strains of bacteria are becoming resistant to one or several types of antibiotics.

Therefore, the research will focus on four pathogens that cause major problems throughout the world. The NCCR’s overriding objective is to initiate a paradigm change in infection research by adopting an interdisciplinary approach that brings together research groups from the fields of clinical research, biology, chemistry, engineering and pharmacology. For further information visit: https://www.nccr-antiresist.ch/en/

NCCR Automation
Dependable Ubiquitous Automation

NCCR Director: Prof. John Lygeros
Home Institution: ETH Zurich
Start date: 1st of August 2020 (5th NCCR series)

Description
The latest advances in sensor technology, data generation and computing have the potential to profoundly change areas of our economic and daily lives. The complete automation and control of entire systems such as cities (smart cities), power grids (smart grids) or industrial processes (Industry 4.0) is increasingly becoming a reality in the course of digital transformation. The aim of the NCCR "Dependable Ubiquitous Automation" is to advance the methodological and technological bases for the large-scale implementation of such complex systems. By improving decision-making and control procedures and developing new algorithms and computer methods, the reliability and flexibility of intelligent systems can be increased. One of the NCCR's key projects is to develop and implement a fully automated and decentralised energy management system at district or commune level. This will allow the economic potential and social impact of automated applications to be tested in real life.

NCCR Catalysis
Sustainable chemical processes through catalyst design

NCCR Director: Prof. Javier Pérez-Ramírez, NCCR Co-Director: Jérôme Waser
Home Institutions: ETH Zurich, EPFL
Start date: 1st of August 2020 (5th NCCR series)

Description
NCCR Catalysis aims to develop new catalytic processes that enable the production of societally-relevant compounds like fine chemicals, pharmaceuticals, and functional materials from abundant and renewable small-molecule feedstocks (e.g., carbon dioxide, methane, water, or nitrogen). To achieve the required fundamental understanding of relevant phenomena at length and time scales spanning ten orders of magnitude – from the atom to the full-scale process – NCCR Catalysis combines multidisciplinary and cross-dimensional modes, connecting research from chemistry, biotechnology, chemical and process engineering, and computer science. The adoption of digital methods sets the foundations for accelerating chemical discovery and the translation into competitive plant-ready technologies with tangible benefits to people and the environment. For further information visit: https://www.nccr-catalysis.ch/

NCCR Evolving Language
The Origins and Future of Language

NCCR Director: Prof. Balthasar Bickel, NCCR Co-Director: Anne-Lise Giraud
Home Institution: University of Zurich, University of Geneva
Start date: 1st of June 2020 (5th NCCR series)

Description
The NCCR "Evolving Language" is researching the evolution of language more broadly than any other research centre to date. The NCCR is using an interdisciplinary approach bringing together research groups from the humanities (linguistics, philosophy), biology, neurosciences, psychology and computer sciences. Researchers are focusing on three issues: firstly, the dynamics of language structures and their evolution; then the biological prerequisites for language, including the related question of whether and how neurotechnologies could or should be used to influence language capabilities; and lastly, the social meaning of language and how it is likely to change with new means of communication.

The NCCR promises innovations and transfer services in medical fields (e.g. diagnosis and treatment of speech disorders) and in the application of digital instruments (human-machine communication, artificial intelligence, complex voice recognition).

NCCR Microbiomes
Microbial communities in health and environment

NCCR Director: Prof. Jan Roelof van der Meer, NCCR Co-Director: Prof. Julia Vorholt
Home Institution: University of Lausanne, ETH Zurich
Start date: 1st of July 2020 (5th NCCR series)

Description
The NCCR Microbiomes brings together an interdisciplinary research program with experimental and clinical microbiome studies. Combining computational, modeling, engineering and synthetic approaches, the Centre aims to understand the unifying principles of microbiome functioning, to develop tools to diagnose microbiome status, and to devise strategies to intervene and restore imbalanced microbiomes. Its scope encompasses microbial communities in human, animals, plants, as well as in natural and industrial environments.

Microorganisms are generally considered as dangerous pathogens. This rather simplistic view does not tell the whole story. Human, animal and plant life is closely linked to the unseen world of microorganisms. Complex and diverse communities of microorganisms populate each human being, animal and plant. These communities, known as microbiomes, play a major role in our lives and our environment, influencing important processes such as protection against disease, nutrient absorption and maintaining a healthy environment.

In the medium term, this research has the potential to create new bases for ground-breaking innovation in major sections of the economy and society, such as nutrition, personalised medicine, medical diagnostics, agriculture and the environment. NCCR SPIN
Spin Qubits in Silicon

NCCR Director: Prof. Richard Warburton, NCCR Co-Director: Daniel Loss
Home Institution: University of Basel
Start date: 1st of August 2020 (5th NCCR series)

Description
The NCCR SPIN aims to make a major contribution to research into and the development of quantum computers and create the basis for a new information-processing technology. The NCCR’s objective is to develop small, fast, scalable silicon-based qubits. It will also generate important findings on software and algorithm development, error correction and the architecture of future quantum computers.

The NCCR comprises an interdisciplinary team with research groups working in experimental and theoretical physics, material science, engineering and computer science. There will also be close cooperation with the industry-based research partner IBM Research, creating exceptional opportunities to develop prototypes and practically applicable technology. This could lay the foundations for accelerating the pace of digitalisation.
